

Enterprise Architecture

Helping clients transform their IT environment

Enterprise Architecture (EA) is a strategic management tool which defines an organization's business; the information necessary to perform the business; the technologies necessary to perform the business; and the transitional processes for implementing new technologies in response to changing business needs.

Vision Technologies' approach to aligning EA with an agency's business needs results in a high performing organization with a clear understanding of its technology investments and business impacts.

Vision provides the following EA Services for our clients:

- ▶ Strategic Planning
- ▶ Technology Roadmap alignment with agency goals
- ▶ IT Architecture planning and implementation
- ▶ Policy and governance strategies
- ▶ Portfolio management

Vision Technologies can bridge the gap between your organization's IT capabilities and its vision for high performance.

We deliver measurable business value from a full range of innovative, industrialized technology consulting solutions. These critical solutions address a CIO's most urgent technology challenges, including:

- ▶ Aligning IT strategy to business value
- ▶ Building an enterprise architecture "blueprint"
- ▶ Transforming IT Infrastructure
- ▶ Improving IT security
- ▶ Renewing legacy applications
- ▶ Engineering performance into systems and applications

Vision Technologies has years of experience helping clients around the world use their IT investments to drive innovation, productivity and growth to achieve higher performance. We can help you too.

Enterprise Architecture defines the IT vision, principles, standards and road map that guide organizations to select, deploy, run and refresh their core technologies.

Strategic investment in enterprise architecture, rather than reactive spending for the maintenance of existing, highly complicated and disparate IT systems, is one of the most vital investments for driving productivity and growth.

Enterprise architecture is not only a blueprint aligning information technology to the dynamic business environment—it can also act as a monitor for the entire information technology environment. Using the tools, Vision Technologies can uncover gaps between business strategies and the technologies required to enable them, as well as identifying opportunities for efficiency and optimization. An enterprise-wide architecture allows organizations to determine whether their IT environment can support emerging technologies, and to predict what effect these technologies will have across the organization.
